INTRODUCTION

One important feature of twentieth-century sculpture is the rôle the painter has played in it. Since the renaissance the painter has held a dominant position in the visual arts, for reasons too complex to examine here. This dominance was so great, in fact, between the seventeenth and nineteenth centuries, that sculpture, with few exceptions, was relegated to a very subsidiary position indeed and was all too often reduced to the making of dull portrait busts and insipid garden statuary. The revival of sculpture in the twentieth century has been largely the result of a healthy interaction between it and painting. Sculptors have looked at painting and have been deeply influenced by every modern painting movement. Painters have looked at sculpture, and many have produced important sculpture themselves.

While these two arts have drawn closer together, modern architecture, Corbusier and the Bauhaus notwithstanding, has for the most part taken a reticent, even stand-offish, position towards them. Whether for aesthetic or economic reasons this unfortunate isolation of one major art from the others is to be deplored. It is to be hoped that before long a union can again be established.

Many modern painters in search of inspiration outside the traditional fields made sterile by the overgrazing of academic artists have turned to non-Western cultures, for example Africa, the Near and Far East, pre-Conquest South America and Oceania, and from these sources, largely represented by sculpture, have received suggestions for new formal experiments and for the extension and enrichment of their imagery. Following their example the modern sculptor has enormously increased the resources of his art as the diversity and complexity of twentieth-century sculpture proves at a glance.

Between the seventeenth and nineteenth centuries the Western sculptor was dependent upon the renaissance-derived, Greco-Roman tradition. Rodin, the father of modern sculpture, remained largely within that tradition but, by the force of his personality, and under the stimulation of revolutionary movements in painting, he gave this tradition a new life after it had practically died at the hands of academic formularizers. Rodin's rhetoric may be difficult for us to accept today, skeptical and inhibited as we are in the face of cataclysmic events. And even during the first decade of the century there was a reaction on the part of such sculptors as Maillol and Brancusi to the dynamic explosiveness of Rodin's forms and subjects. As Cézanne had endeavored to control and give substance to the evanescent light

effects of the impressionists, so Maillol tamed the fiery gestures of Rodin and in the closed, compact rhythms of his compositions, based almost wholly on the female nude, presented a contained and idealized version of the human figure which has influenced a great many modern sculptors. He was in love with Greece as Cézanne was with Poussin and in their different ways they can be called neo-classic in temperament as opposed to the expressionist abandon of Rodin.

Rodin has had his followers and those who have associated themselves directly or indirectly with him, for example Matisse and Picasso in their beginnings, and after a long cubist phase, Lipchitz. Brancusi also, the third of the great triumvirate of modern sculptors, came under Rodin's influence in his youth. However, he early took a contrary direction in a search for a control and purification of form which owes nothing to Rodin nor to the tradition from which he stems. Born in Rumania, one of the crossroads between Asia and Europe, Brancusi retains much of the Asiatic's love for the occult and the mysterious. The abstract treatment of form in certain prehistoric art, the geometrical refinement of some Oriental sculpture, the elementary grasp of formal relations in African sculpture appealed to him and from their example he set out to by-pass the traditional sculpture of the West. To release the image imprisoned in the stone or wood by a reduction of the material to its absolute essence was his intention. The removal of particularizing detail is an objective comparable to the neo-classic idealization of form. Both points of view look to a type rather than to an individual. Maillol's woman is a formal idea, not a portrait of a particular nude. The idea in his case is bound to a great Western tradition. Brancusi's *Bird in Space*, on the other hand, reaches out to a universal, transcendental idea of flight, an idea, whatever its non-Western origins, that had never been as completely expressed before.

If the first decade of the century is dominated by three great personalities: Rodin, Maillol and Brancusi, the second decade is marked by three movements: cubism, futurism and constructivism. Each follows a more or less abstract direction. Between 1908 and 1914 the cubist revolution took place, a revolution comparable to the discovery of perspective in the renaissance. Cubism was actually a new multi-focus perspective for the examination or analysis simultaneously of different views of an object or figure either at rest, as with the cubists proper, such as Picasso, Braque, Lipchitz and Laurens, or in motion, as with the futurist Boccioni or the futurist-derived Duchamp-Villon. Brancusi's abstract purification of the object, the cubists' and futurists' geometrical dissection of it in a static or kinetic state all had to do with the animal or human figure or the still life in relation to space. The most extreme of all the abstractionists were the so-called constructivists. Deriving some of their ideas from the cubists, first in Russia, later in Germany, Holland, France and England, they pushed abstraction to its extreme geometrical limit by divorcing their shapes or forms from any organic or human reference. Theirs was an effort above all to make space rather than mass the primary consideration in sculpture.

The surrealists, beginning in the twenties, reacted violently to what they considered was the sterile intellectualism of abstract art of whatever degree. As a corrective

they explored the world of subconscious experience and from this source created an imagery of fantastic, horrific dimensions. Arp, Gonzalez and Giacometti are, or were, the leading exponents of surrealist sculpture and their influence, particularly Arp's and Gonzalez', has been widespread.

While surrealism ceased being an organized movement before the beginning of World War II, its influence, together with that of the constructivists, has continued until today. By a sort of fusion of the two, in fact, there has been produced a new avant-garde movement now vaguely called abstract expressionism, whose principal practitioners are American. At the same time, during the last decade and a half there has been a return by some of the older sculptors to more naturalistic forms. Picasso, Lipchitz and Laurens and some of the younger Italians such as Marini and Manzù are examples of this tendency.

In short, modern sculpture, like all other aspects of the twentieth century, has been in a constant state of flux and at the present moment shows no signs of arriving at any final resolution. Herein perhaps is the secret of its extraordinary diversity and nervous vitality.

The present exhibition is designed to give the observer as comprehensive a view as possible of twentieth-century sculpture in all its richness and variety of expression. What has been attempted is to present a balanced picture of the giants of modern sculpture, including outstanding painter-sculptors, the various movements they represent, their followers or those who are stylistically related to them and, finally, a limited selection of work being done today. The latter section is suggestive rather than representative since, for reasons of space, many younger artists from abroad have had to be omitted.
